2 (twice amended). A flat panel display apparatus for receiving display informa-
tion including video data and synchronizing data from a host processing digital data in a
serial digital communication, said display apparatus adapted for operation without need
for any analog-to-digital converter (ADC) or phase-locked loop (PLL) circuit for signal
conversion, said display apparatus comprising:
a receiver for reconstructing said display information;
a synchronizing signal generator for generating a synchronizing signal by
extracting the synchronizing data from said reconstructed display
information,
a digital-to-analog converter (DAC) for converting said video data to a cor-
responding analog video signal;
an output terminal for externally transferring said synchronizing signal and
analog video signal to an analog display apparatus; and
a video data converter for converting line and dot numbers of said video
data so as to correspond to a prescribed display mode when said syn-

chronizing data has a different characteristic from said prescribed display mode, and said synchronizing signal generator generates said synchronizing signal corresponding to said display mode.
